

Filter

#Filter #Controller #JavaEE

Review

- How to remove all java code in JSP (View)? Complete the MVC 2 Design Pattern with View
 - -JSTL
- How to build the data grid tag library using in JSP?
 - Tag Libraries
 - Model
 - Classical, Simple, and Handles
 - How to implement the custom Tag Lib and use it in JSP

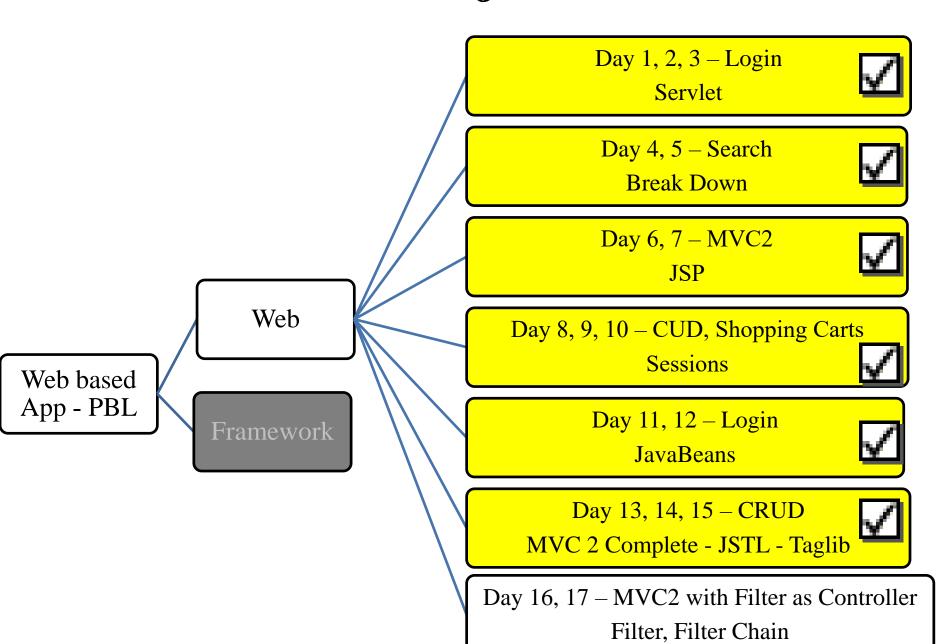

Objectives

- How to build application using MVC2 Pattern using Filter as Controller?
 - Filter
 - Filter Chain

Objectives

Requirements

- Preprocess request and Postprocess response in web application
- Build the Project CRUD, Online Shopping applying MVC2 pattern with Filter as Controller

Overview

- Are components that add functionality to the request and response processing of a Web Application
 - Intercept the requests and response that flow between a client and a Servlet/JSP.
 - Supports dynamic modification of requests and responses between client and web applications.
 - Dynamically access incoming requests from the user before the servlet processes the request
 - Access the outgoing response from the web resources before it reaches the user
- Categorized according to the services they provide to the web applications
- Resides in the web container along with the web applications
- Was introduced as a Web component in Java servlet specification version 2.3

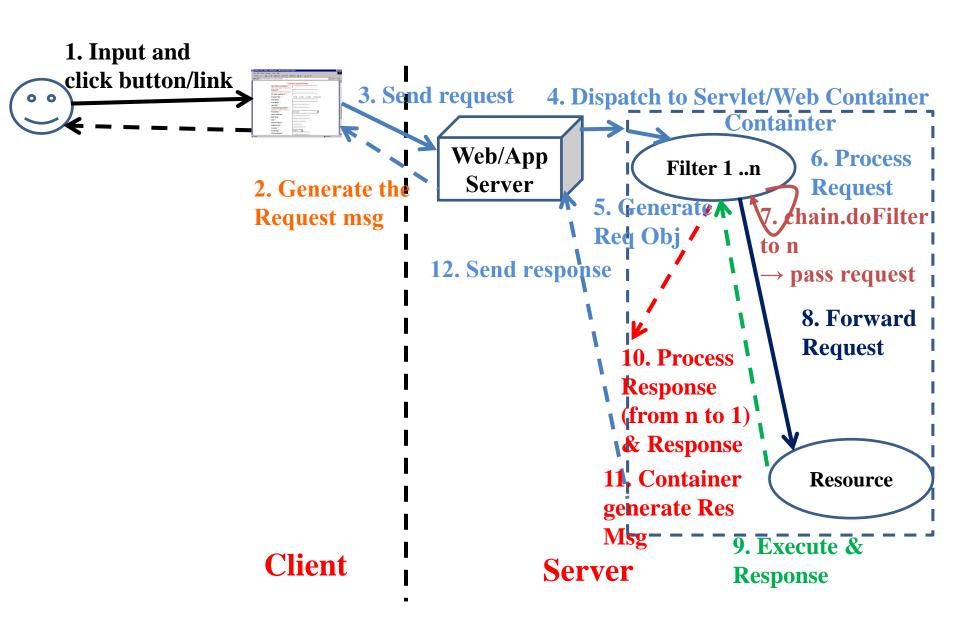

Overview

- Are components that add functionality to the request and response processing of a Web Application
 - Intercept the requests and response that flow between a client and a Servlet/JSP.
 - Supports dynamic modification of requests and responses between client and web applications.
 - Dynamically access incoming requests from the user before the servlet processes the request
 - Access the outgoing response from the web resources before it reaches the user
- Categorized according to the services they provide to the web applications
- Resides in the web container along with the web applications
- Was introduced as a Web component in Java servlet specification version 2.3

Interactive Filter Model

Usage

- Authorize request
- Altering request headers and modify data
- Modify response headers and data
- Authenticating the user
- Comprising files
- Encrypting data
- Converting images
- Logging and auditing filters
- Filters that trigger resource access events

FPT Fpt University

Filter

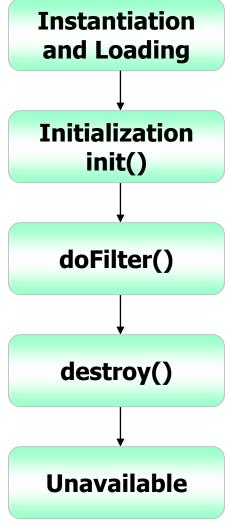

Benefits - Advantages

- Optimization of the time taken to send a response
- Compression of the content size before sending
- Optimization of the bandwidth
- Security
- Identify the type of request coming from the Web client, such as HTTP and FTP, and invoke the Servlet that needs to process the request.
- **Retrieve** the user information from the request parameters to authenticate the user.
- Validate a client using Servlet filters before the client accesses the Servlet.
- **Identify** the **information** about the MIME types and other header contents of the request.
- Facilitate a Servlet to communicate with the external resources.
- **Intercept** responses and compress it before sending the response to the client

Life Cycle

- Working of Filter
 - The filter intercepts the request from a user to the servlet
 - The filter then provides customized services
 - The filter sends the serviced response or request to the appropriate destination

API

- Creates and handles the functionalities of a filter
- Contains three interfaces
 - Filter Interface, FilterConfig Interface, FilterChain Interface

Filter Interface

- Must be implemented to create a filter class **extends javax.servlet.Filter**
- An object performs filtering tasks on the request and the response

Methods	Descriptions				
init	 - public void init(FilterConfig fg); - Called by the servlet container to initialize the filter - Called only once - Must complete successfully before the filter is asked to do any filtering work 				
doFilter	 public void doFilter(ServletRequest req, ServletResponse res, FilterChain chain) throws IOException, ServletException Called by the container each time a request or response is processed Then examines the request/response headers & customizes them as per the requirements Passed the request/response through the FilterChain object to the next entity in the chain 				
destroy	 - public void destroy(); - Called by the servlet container to inform the filter that its service is no more required - Called only once. 				

Configuration

In Web Deployment Descriptor

```
<web-app>
<filter>
   <filter-name>Name of Filters</filter-name>
   <filter-class>implemented Filter Class</filter-class>
   [<init-param>
       <param-name>parameter name/param-name>
       <param-value>value </param-value>
   </init-param>]
  </filter>
 <filter-mapping>
    <filter-name>FilterName</filter-name>
   </filter-mapping>
</web-app>
```

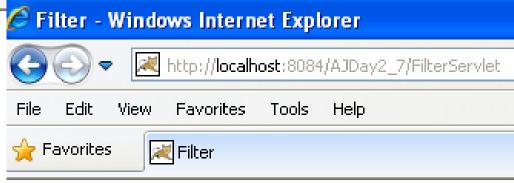

• Building the web application shows as the following GUI in sequence

Filter Chain

Definition

- There can be **more than one filter** between the user and the endpoint Invoke a **series of filters**
- A request or a response is **passed through one** filter to the **next** in the filter chain. So each request and response has to be serviced by each filter forming a filter chain
- If the Calling filter is last filter, will invoke web resource

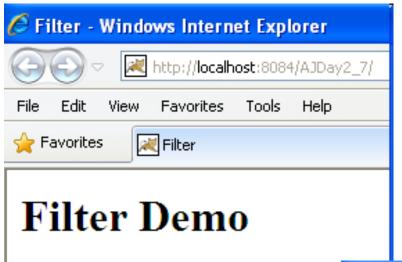

FilterChain Interface

- Provides an object through the web container
- The object invokes the next filter in a filter chain starting from the first filter from a particular end. If the calling filter is the last filter in the chain, it will invoke the web resource, such as JSP and servlet.
- Only implement doFilter() method.
- Forces the next filter in the chain to be invoked

Filter Chain

Filter Chain Why need a Wrapper Class

```
📸 SecondFilter.java 🗶
            1
          public void doFilter (ServletRequest request, ServletResponse response,
 99
                  FilterChain chain)
100 🗐
                  throws IOException, ServletException {
101
              try {
102
                  System. out.println("Pass Second Filter - request");
103
                  request.setAttribute("KEY1", "Second Filter");
104
                  chain.doFilter(request, response);
105
                  System. out.println("Pass Second Filter - response");
106
                  request.setAttribute("KEY1", "Second Filter Again");
107
                  PrintWriter out = response.getWriter();
108
                  out.println("<br/>The slide is licensed to KhanhKT");
109
              } catch (Throwable t) {
                  t.printStackTrace();
111
              }
112
```

Filter Chain

Why need a Wrapper Class

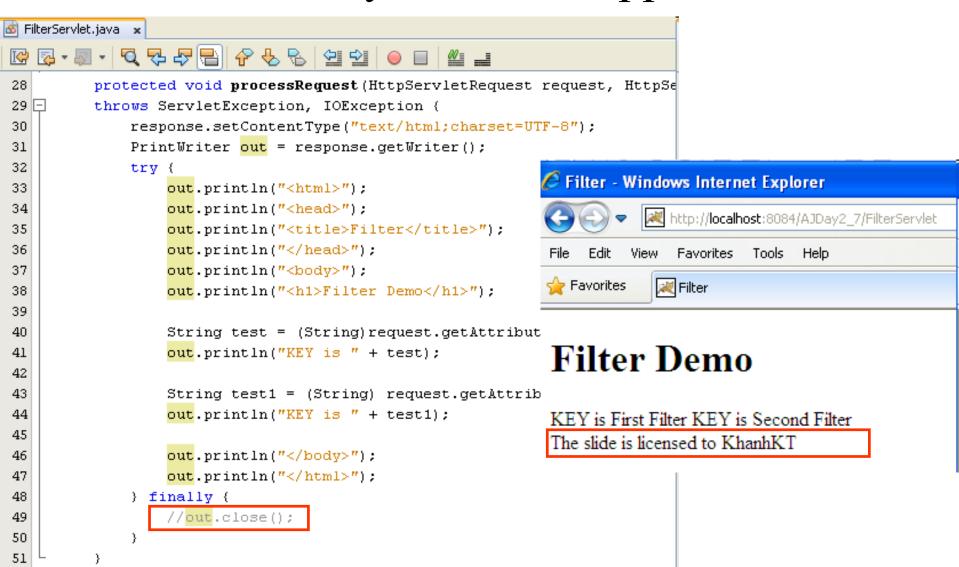

Filter Demo

KEY is First Filter KEY is Second Filter

Filter Chain

Why need a Wrapper Class

Filter Chain Wrapper Class

- To modify or intercept the request or response before they can reach their logical destination, the required object can dynamically capture the request or response
- Wrapper class

ServletResponseWrapper

- Creates the object to **capture the request and response** before they reach server and client respectively
- The wrapper object generated by the filter **implements the getWriter() and getOutputStream(),** which returns a stand-in-stream. The stand-in-stream is passed to the servlet through the wrapper object
- The wrapper object captures the response through the stand-in-stream and sends it back to the filter

Classes	Descriptions					
ServletRequestWrapper	 Provides a convenient implementation of the ServletRequest interface Can be sub-classed by developers wishing to send the request to a servlet To override request methods, one should wrap the request in an object that extends ServletRequestWrapper or HttpServletRequestWrapper 					
	- Provides a convenient implementation of the ServletResponse					

- Can be sub classed by developers wishing to send the response from

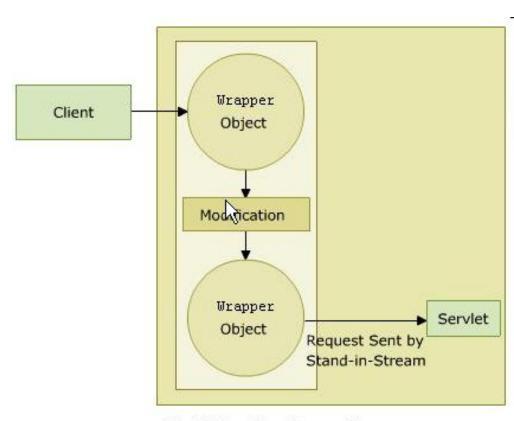

interface

a servlet.

Wrapper Class – Altering Request

- Create filter class extends to the ServletRequestWrapper or HttpServletRequestWrapper class.
- The object captures the HttpRequest object from the client and sends it to the filers
- Through the objects filter extends some services to the request.

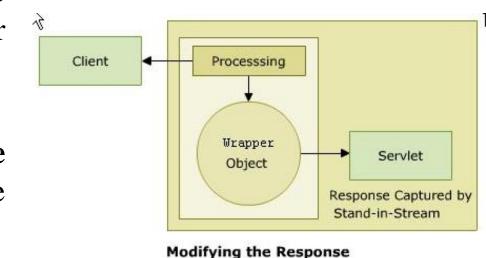

Modifying the Request

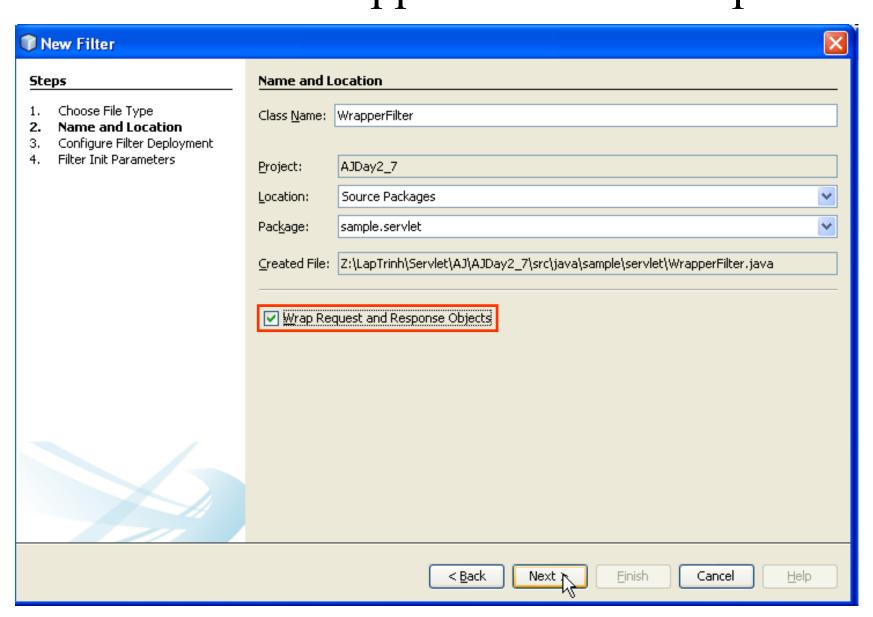

Wrapper Class – Altering Response

- Create filter class extends to the ServletResponseWrapper or HttpServletResponseWrapper class.
- The object captures the httpRequest object from the client and sends it to the filers
- Through the objects filter extends some services to the request.

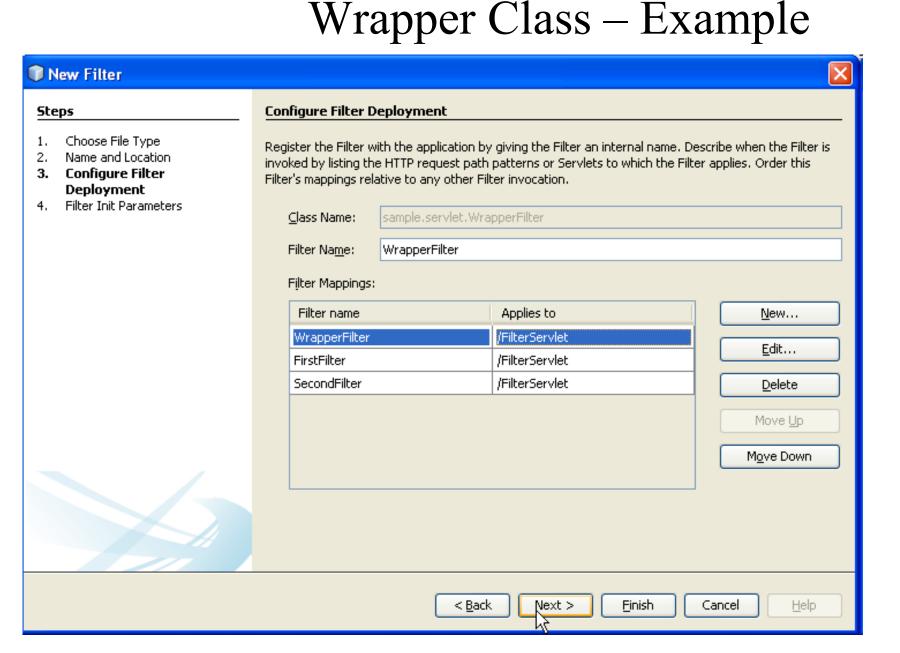

Filter Chain Wrapper Class – Example

Wrapper Class – Example

•Adding the MyPrinter class extends PrintWriter in FilterWrapper class

```

404
405
406
            class MyPrinter extends PrintWriter {
407
                 public MyPrinter (Writer out) {
408
                     super (out);
409
410
 ₩+
                 public void close() {
412
                     super.close();
413
414
415
```

Wrapper Class – Example

•Modifying the ResponseWrapper class uses MyPrinter to output stream

```
WrapperFilter.java 🗴
         323 🗐
         class ResponseWrapper extends HttpServletResponseWrapper {
324
             private MyPrinter out;
325 F
             public ResponseWrapper(HttpServletResponse response) {
326
                 super (response);
327
                 try (
328
                     out = new MyPrinter(response.getWriter());
329
                 }catch (IOException e) {
                     e.printStackTrace();
331
332
             }
333
             public PrintWriter qetWriter() throws IOException {
335
                 return out:
336
             }
```

Wrapper Class – Example

```
WrapperFilter.java x
133
 0
          public void doFilter (ServletRequest request, ServletResponse response,
135
                                FilterChain chain)
136 🖃
              throws IOException. ServletException {
137
              HttpServletResponse resp = (HttpServletResponse) response;
138
              ResponseWrapper wrapperResp = new ResponseWrapper(resp);
139
              try {
140
                   chain.doFilter(request, wrapperResp);
141
                   PrintWriter out = wrapperResp.getWriter();
                   out.println("<br/>The slide is licensed to KhanhKT");
142
143
                   out.close();
144
145
              catch(Throwable t) {
                   t.printStackTrace();
147
              }
148
```

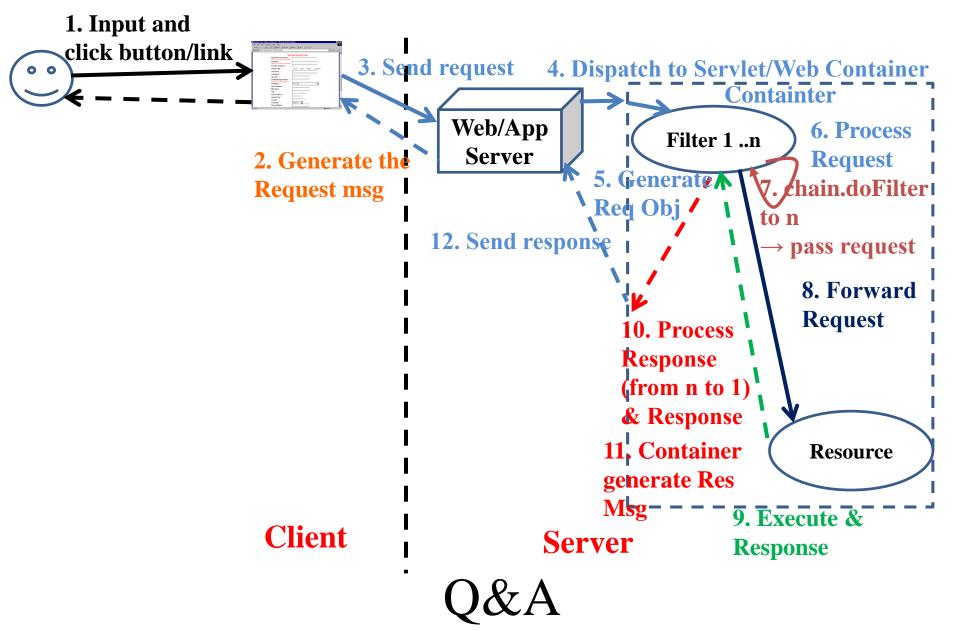

MVC2

Filter Acts as Controller

- While a servlet is the most common controller, a filter can act as a controller too
- While a servlet only handles access to the dynamic part of the application, a filter can serve all the resources in application, including static ones
- A filter as the controller allows to block all requests to the application, including request for static contents
